

Construct a bot to print data on notepad
 First of all we create a sequence then we click on open application and in meantime we also opened our notepad so we can perform activities effectively or for open application we may also use in do the input debug.

- Then in open application we put the notepad and in do part we write the command which we want to display on notepad.

- Then we just click and put the condition i.e. file and again we use another click to save the file by save as.

- Now we use type onto in which we select file name and lastly again select the save option our file get saved.
 - Then debug the file , our program get executed.
